Understanding Feedback Control Systems

What Are Feedback Control Systems?

Feedback control systems are mechanisms that automatically regulate the behavior of a system to achieve desired performance. They work by continuously measuring the system's output and comparing it to a target value or setpoint. Any deviation triggers corrective actions to bring the system back to its desired state.

Components of a Feedback Control System

A typical feedback control system consists of:

- **Actuator:** Implements the control action on the system.
- **Plant:** The process or system to be controlled.

Types of Feedback Control Systems

Feedback systems can be categorized into:

- **Open-Loop Systems:** No feedback; control action is independent of output.
- **Closed-Loop Systems:** Incorporate feedback for dynamic adjustment based on output measurements.
