Understanding Geometric Transformations

Before diving into specific answers, it's vital to understand the fundamental types of transformations in geometry. These transformations alter the position, size, or orientation of a figure while maintaining certain properties.

Types of Transformations

- **Translations:** Moving a figure from one location to another without rotating or resizing. The shape and size stay the same.
- **Rotations:** Turning a figure around a fixed point (the center of rotation) by a specified angle.
- **Reflections:** Flipping a figure over a line (the line of reflection), creating a mirror image.
- **Dilations:** Resizing a figure proportionally from a center point, either enlarging or reducing it by a scale factor.

Approach to Solving Transformation Problems

To effectively find answers for all transformation questions, follow a structured approach:

Step 1: Identify the Type of Transformation

- Carefully read the problem to determine if it involves translation, rotation, reflection, or dilation.
- Look for keywords such as "slide," "flip," "turn," "rotate," "enlarge," or "shrink."

Step 2: Understand the Given Data

- Note the original figure's coordinates if provided.
- Record the parameters: translation vector, angle and center of rotation, line of reflection, or scale factor and center of dilation.

Step 3: Apply the Appropriate Transformation Rules

- Use transformation formulas and rules specific to each type.
- For example, for translation, add the translation vector to each point; for rotation, apply rotation formulas.

Step 4: Calculate and Verify Coordinates

- Perform calculations carefully.
- Plot points if needed to visualize the transformation.
- Confirm that the transformed figure maintains the properties expected.

Step 5: Double-Check Your Work

- Ensure that distances and angles are preserved or changed as expected.
- Cross-verify with the problem's requirements.

Detailed Solutions for Common Transformation Problems

This section offers step-by-step solutions and tips for typical transformation questions encountered in Kuta Software Infinite Geometry.

1. Translating a Figure

Problem Example: The triangle with vertices at A(2, 3), B(4, 7), and C(6, 3) is translated 3 units right and 2 units down. Find the new coordinates.

- Identify the translation vector: (3, -2).
- Apply the translation to each vertex:
 - A(2, 3) ? $(2 + 3, 3 - 2) = (5, 1)$
 - B(4, 7) ? $(4 + 3, 7 - 2) = (7, 5)$
 - C(6, 3) ? $(6 + 3, 3 - 2) = (9, 1)$

Answer: The translated triangle has vertices at A'(5, 1), B'(7, 5), C'(9, 1).

2. Rotating a Figure

Problem Example: Rotate a point P(3, 4) 90° clockwise about the origin. Find the new coordinates.

- Recall that for a 90° clockwise rotation around the origin:
- $(x, y) \rightarrow (y, -x)$
- Apply the rule:
- $P(3, 4) \rightarrow (4, -3)$

Answer: The new coordinates are (4, -3).

3. Reflecting a Figure

Problem Example: Reflect the point Q(-2, 5) across the y-axis.

- Reflecting across the y-axis changes (x, y) to $(-x, y)$.
- Apply:
- $Q(-2, 5) \rightarrow (2, 5)$

Answer: The reflected point is (2, 5).

4. Dilating a Figure

Problem Example: Dilate point R(4, 3) from the origin with a scale factor of 2.

- Multiply both coordinates by the scale factor:
- $R(4, 3) \rightarrow (4 \times 2, 3 \times 2) = (8, 6)$

Answer: The dilated point is (8, 6).

Advanced Transformation Problems and Strategies

Some problems may combine multiple transformations or involve more complex parameters. Here's how to approach such challenges.

Combining Transformations

- When multiple transformations are applied sequentially, perform them in the order given.
- For example, translating then rotating requires applying translation formulas first, then rotation formulas on the new coordinates.

Using Transformation Matrices

- For more complex or multiple transformations, matrices provide an efficient method.
- Each transformation has a corresponding matrix:
 - Translation: handled via vector addition.
 - Rotation and dilation: represented by 2x2 matrices.
- Multiply matrices and coordinate points to find the transformed coordinates.

Example of Combining Rotation and Reflection

- Rotate a point about the origin, then reflect across a line.
- Carefully perform each step, verifying at each stage.
