Question What is a quick trick to multiply any number by 5? To multiply a number by 5, multiply it by 10 and then divide the result by 2. For example, $36 \times 5 = (36 \times 10) \div 2 = 360 \div 2 = 180$. How can I quickly find the square of numbers ending with 5? For numbers ending with 5,

multiply the digit before 5 by its next consecutive number and then append 25. For example, 75^2 : $7 \times 8 = 56$, so $75^2 = 5625$. What is a shortcut to estimate the percentage of a number? To find, say, 20% of a number, divide the number by 5. For 20%, divide the number by 5; for 10%, divide by 10, and so on. How can I quickly determine if a number is divisible by 3? Sum all the digits of the number; if the sum is divisible by 3, then the number itself is divisible by 3. Is there an easy way to find the cube of small numbers mentally? Yes, memorize cubes of numbers from 1 to 10. For larger numbers, use binomial expansion or approximate methods, but mental calculation of small cubes is straightforward with practice. What trick helps in quickly multiplying two numbers close to 100? Use the base 100. Subtract each number from 100, multiply those differences, and add the differences to 100 of one number. For example, 98×97 : $(100-2)$ and $(100-3)$. Multiply differences: $2 \times 3 = 6$. Add differences: $98 + 97 = 195$. The answer: $19500 + 6 = 18906$. How can I easily find the percentage increase or decrease between two numbers? Subtract the original number from the new number, divide by the original number, and multiply by 100 to get the percentage change. For example, from 50 to 60: $(60 - 50) / 50 \times 100 = 20\%$ increase. What is a quick way to check the last digit of a product without multiplying fully? Focus on the last digits of the numbers. Multiply only the last digits to find the last digit of the product. For example, 23×47 : last digits are 3 and 7; $3 \times 7 = 21$, so last digit is 1. How can I use approximation tricks to save time in aptitude tests? Round numbers to the nearest convenient value, perform the calculation mentally, and then adjust the result accordingly. This speeds up calculations while maintaining reasonable accuracy.
